Thank you to Hope Steele for her superb copyediting work and Neil Weinberg for his excellent graphic design and layout.

We are very grateful to Kamal Kamaoui and the World Economic Forum's Publications team for their invaluable collaboration on the production of this *Report*.

In addition we offer a special thank you to Miguel Perez at the World Economic Forum for his vital contribution to programming related to index calculations and country profiles. We would also like to thank Sabrina Roshan for her research during her internship with the World Economic Forum.

The terms *country* and *nation* as used in this report do not in all cases refer to a territorial entity that is a state as understood by international law and practice. The term covers well-defined, geographically self-contained economic areas that may not be states but for which statistical data are maintained on a separate and independent basis.

Preface

KLAUS SCHWAB

Founder and Executive Chairman, World Economic Forum

Over the last year, the world has seen the biggest recession in almost a century. It is clear that recovery will require, among other things, the best of talent, ideas and innovation. It is therefore more important now than ever before for countries and companies to pay heed to one of the fundamental cornerstones of economic growth available to them—the skills and talent of their female human resource pool. As consumers, voters, employees and employers, women will be integral to global economic recovery. However, it is not only the financial and economic system that is in need of rethinking, redesigning and rebuilding. Global challenges such as climate change, food security, conflict, education and health require our immediate, collective efforts to find solutions and will, in fact, be intimately linked to our long-term global economic recovery. Girls and women make up one half of the world's population—without their engagement, empowerment and contribution, we cannot hope to effectively meet these challenges nor achieve rapid economic recovery.

And yet, there is still much work to be done in education, health, the workplace, legislation and politics before women around the globe enjoy the same opportunities as men. There are still millions of “missing” women each year because of the preference for sons in some parts of the world. There are too many female infants who do not receive adequate access to healthcare because of the lower value placed on girls, adding to the global burden of infant mortality. Girls are still missing out on primary and secondary education in far greater numbers than boys, thus depriving entire families, communities and economies of the proven and positive multiplier effects generated by girls' education and instead aggravating poverty, the spread of HIV/AIDS, and maternal and infant mortality. In those countries where women do indeed receive the benefits of health and education, far too many are then unable to contribute fully and productively to the economy because of barriers to their entry into the workforce or barriers to accessing positions of leadership. Finally, women still remain vastly under-represented in political leadership and decision-making. The combined impact of these gaps entails colossal losses to the global society and economy.

Measuring the size of the problem is a prerequisite for identifying the best solutions. Through the *Global Gender Gap Reports*, for the past four years, the World Economic Forum has been quantifying the magnitude of gender-based disparities and tracking their progress over time. By

providing a comprehensive framework for benchmarking global gender gaps, the *Report* reveals those countries that are role models in dividing resources equitably between women and men, regardless of their level of resources. The World Economic Forum places a strong emphasis on a multi-stakeholder approach in order to engage leaders to design the most effective measures for tackling global challenges. In 2008, we launched our Global Gender Parity Group and Regional Gender Parity Groups in Latin America, the Middle East, Africa and Asia. To date, these multi-stakeholder communities of highly influential leaders—50% women and 50% men—from business, politics, academia, media and civil society have jointly identified the biggest gaps in each region, based in part on the findings of this *Report*, and have collectively committed to strategies to improve the use of female talent. In addition, our Global Agenda Council on the Gender Gap, an expert council, is using the findings of this *Report* as one of the inputs for developing proposals to address gaps in international cooperation towards gender equality. Each of the individuals and organizations represented in these communities work collectively towards empowering women, developing globally replicable frameworks and bringing the world ever closer to achieving gender parity.

We would like to express our deep appreciation to Ricardo Hausmann, Director, Center for International Development, Harvard University; Laura D. Tyson, Professor of Business Administration and Economics, University of California, Berkeley, USA; and Saadia Zahidi, Director, Constituents, for their invaluable contribution to this *Report*. We would also like to thank Damaris Papoutsakis and Yasmina Bekhouche for their excellent research assistance on this project at the World Economic Forum.

From a values and social justice perspective, empowering women and providing them with equal rights and opportunities for fulfilling their potential is long overdue. From a business, economic and competitiveness viewpoint, targeting gender parity is a necessary condition for progress. The aim is thus to achieve parity of participation and opportunity while facilitating diversity of thoughts, opinions and approaches. It is our hope that this *Report* will serve to highlight the countries that have made continued, often remarkable, progress over the last year in closing the distance to parity and will act as an urgent call for action towards the work that still needs to be done elsewhere to fully harness the skills and talents of one half of humanity.

Part 1

Measuring the Global Gender Gap

The Global Gender Gap Index 2009

RICARDO HAUSMANN, Harvard University

LAURA D. TYSON, University of California, Berkeley

SAADIA ZAHIDI, World Economic Forum

The Global Gender Gap Index,¹ introduced by the World Economic Forum in 2006, is a framework for capturing the magnitude and scope of gender-based disparities and tracking their progress. The Index benchmarks national gender gaps on economic, political, education- and health-based criteria, and provides country rankings that allow for effective comparisons across regions and income groups, and over time. The rankings are designed to create greater awareness among a global audience of the challenges posed by gender gaps and the opportunities created by reducing them. The straightforward methodology and quantitative analysis behind the rankings are intended to serve as a base for designing effective measures for reducing gender gaps.

The first part of this chapter reviews the underlying concepts employed in creating the Global Gender Gap Index and outlines the methods used to calculate the Index. The second part of this chapter presents the 2009 rankings, global patterns and regional performance and calls attention to notable country cases. Next, we provide an overview of the links between gender gaps and the economic performance of countries. In the fourth part of this chapter, we have also provided information on the trends revealed by the Index in the four years that we have been producing it. In a special section, Ricardo Hausmann and his colleagues provide an analysis of the dynamics of the gender gap based on census data. Finally, we include new appendixes this year that are focused on two important development goals: girls' education (Appendix D) and maternal health (Appendix E).

The Country Profiles contained in Part 2 of this *Report* give a more detailed picture of the relative strengths and weaknesses of each country's performance compared with that of other nations. Each profile contains detailed information on over 30 gender-related variables, presenting both the original data used to create the Index and other variables that reflect some of the legal and social factors that affect gender disparity in each country.

Measuring the global gender gap

Three underlying concepts

There are three basic concepts underlying the Global Gender Gap Index. First, it focuses on measuring gaps rather than levels. Second, it captures gaps in outcome variables rather than gaps in means or input variables. Third, it ranks countries according to gender equality rather than women's empowerment. These three concepts are briefly outlined below. For a description of how these concepts are captured by the construction techniques used in the creation of the Index, please see the section below on the *Construction of the Index*.

Gaps vs. levels

The Index is designed to measure gender-based gaps in access to resources and opportunities in individual countries rather than the actual levels of the available resources and opportunities in those countries. We do this in order to make the Global Gender Gap Index independent of the level of development. In other words, the Index is constructed to rank countries on their gender gaps not on their development level. Rich countries have more education and health opportunities for all members of society and measures of levels thus mainly reflect this well-known fact, although it is quite independent of the gender-related issues faced by each country at their own level of income. The Global Gender Gap Index, however, rewards countries for smaller gaps in access to these resources, regardless of the overall level of resources. For example, the Index penalizes or rewards countries based on the size of the gap between male and female enrolment rates, but not for the overall levels of education in the country.

Outcomes vs. means

The second basic concept underlying the Global Gender Gap Index is that it evaluates countries based on outcome variables rather than input measures. Our aim is to provide a snapshot of where men and women stand with regard to some fundamental outcome variables related to basic rights such as health, education, economic participation and

The Global Gender Gap Index, co-authored by Fiona Greig, Ricardo Hausmann, Laura D. Tyson and Saadia Zahidi, was first introduced in the World Economic Forum's *Global Gender Gap Report 2006*. The authors are deeply grateful to Damaris Papoutsakis and Yasmina Bekhouche for their excellent research assistance. Box 1 is authored by Ricardo Hausmann, Ina Ganguli and Martina Viarengo of Harvard University.

political empowerment. Variables related to country-specific policies, culture or customs—factors that we consider to be “input” or “means” variables—are not included in the Index, but they are displayed in the Country Profiles. For example, the Index includes a variable comparing the gap between men and women in high-skilled jobs such as legislators, senior officials and managers (an outcome variable) but does not include data on length of maternity leave (a policy variable).

Gender equality vs. women’s empowerment

The third distinguishing feature of the Global Gender Gap Index is that it ranks countries according to their proximity to gender equality rather than to women’s empowerment. Our aim is to focus on whether the gap between women and men in the chosen variables has declined, rather than whether women are “winning” the “battle of the sexes”. Hence, the Index rewards countries that reach the point where outcomes for women equal those for men, but it neither rewards nor penalizes cases in which women are outperforming men in particular variables.

The four pillars

The Global Gender Gap Index examines the gap between men and women in four fundamental categories: *economic participation and opportunity*, *educational attainment*, *political empowerment* and *health and survival*. Table 1 displays all four of these subindexes and the 14 different indicators that form part of them.

Economic participation and opportunity

This area is captured through three concepts: the participation gap, the remuneration gap and the advancement gap. The participation gap is captured through the difference in labour force participation rates. The remuneration gap is captured through a hard data indicator (ratio of estimated female-to-male earned income) and a qualitative variable calculated through the World Economic Forum’s Executive Opinion Survey (wage equality for similar work). Finally, the gap between the advancement of women and men is captured through two hard data statistics (the ratio of women to men among legislators, senior officials and managers, and the ratio of women to men among technical and professional workers).

Educational attainment

In this category, the gap between women and men’s current access to education is captured through ratios of women to men in primary-, secondary- and tertiary-level education. A longer-term view of the country’s ability to educate women and men in equal numbers is captured through the ratio of the female literacy rate to the male literacy rate.

Political empowerment

This category includes mainly measures of the gap between men and women in political decision-making at the highest levels. This concept is captured through the ratio of women to men in minister-level positions and the ratio of women to men in parliamentary positions. In addition, we include the ratio of women to men in terms of years in executive office (prime minister or president) in the last 50 years. A clear drawback in this category is the absence of any variables capturing differences between the participation of women and men at local levels of government. Should such data become available at a global level in future years, they will be considered for inclusion in the Global Gender Gap Index.

Health and survival

This category attempts to provide an overview of the differences between women and men’s health. To do this, we use two variables. First, we use the gap between women and men’s healthy life expectancy, calculated by the World Health Organization. This measure provides an estimate of the number of years that women and men can expect to live in good health, by taking into account the years lost to violence, disease, malnutrition or other relevant factors. The second variable included in this subindex is the sex ratio at birth. This variable aims specifically to capture the phenomenon of “missing women” prevalent in many countries with strong son preference.

Construction of the Index

The Global Gender Gap Index is constructed using a four-step process, outlined below.

Convert to ratios

First, all data are converted to female/male ratios. For example, a country with 20% of women in ministerial positions is assigned a ratio of 20 women / 80 men = 0.25 on this variable. This is to ensure that the Index is capturing gaps between women and men’s attainment levels rather than the levels themselves.

Truncate data at equality benchmark

As a second step, these ratios are truncated at the “equality benchmark”. On all variables, except the two health variables, this equality benchmark is considered to be 1, meaning equal numbers of women and men. In the case of the sex ratio at birth, the equality benchmark is set to be 0.944,² and the healthy life expectancy benchmark is set to be 1.06.³ Truncating the data at the equality benchmarks for each variable translates to assigning the same score to a country that has reached parity between women and men and one where women have surpassed men.

The type of scale chosen determines whether the Index is rewarding “women’s empowerment” or “gender equality”.⁴ To capture “gender equality”, two possible scales were considered. One was a negative-positive scale

Table 1: Structure of the Global Gender Gap Index

Subindex	Variable	Source
Economic Participation and Opportunity	Ratio: Female labour force participation over male value	International Labour Organization, <i>Key Indicators of the Labour Market</i> , 2007
	Wage equality between women and men for similar work (converted to female-over-male ratio)	World Economic Forum, Executive Opinion Survey 2009
	Ratio: Estimated female earned income over male value	United Nations Development Programme, Human Development Index 2008 Update and <i>Human Development Report 2007/2008</i> , 2005 or latest data available
	Ratio: Female legislators, senior officials and managers over male value	International Labour Organization, <i>LABORSTA Internet</i> , online database, 2007 or latest data available; United Nations Development Programme, Human Development Index 2008 Update, <i>Human Development Report 2007/2008</i> , 2005 or latest data available
	Ratio: Female professional and technical workers over male value	International Labour Organization, <i>LABORSTA Internet</i> , online database, 2007 or latest data available; United Nations Development Programme, Human Development Index 2008 Update and <i>Human Development Report 2007/2008</i> , 2005 or latest data available
Educational Attainment	Ratio: Female literacy rate over male value	United Nations Development Programme, Human Development Index 2008 Update and <i>Human Development Report 2007/2008</i> , 2005 or latest data available; UNESCO Institute for Statistics, <i>Education Indicators</i> , 2007 or latest data available; World Bank's <i>World Development Indicators</i> , Online Database, 2007 or latest available data
	Ratio: Female net primary level enrolment over male value	UNESCO Institute for Statistics, <i>Education Indicators</i> , 2008 or latest data available; World Bank's <i>World Development Indicators</i> , Online Database, 2008 or latest available data
	Ratio: Female net secondary level enrolment over male value	UNESCO Institute for Statistics, <i>Education Indicators</i> , 2008 or latest data available; World Bank's <i>World Development Indicators</i> , Online Database, 2008 or latest available data
	Ratio: Female gross tertiary level enrolment over male value	UNESCO Institute for Statistics, <i>Education Indicators</i> , 2008 or latest data available; World Bank's <i>World Development Indicators</i> , Online Database, 2008 or latest available data
Health and Survival	Ratio: Female healthy life expectancy over male value	World Health Organization, Online Database (WHOSIS), data from 2003
	Sex ratio at birth (converted to female-over-male ratio)	Central Intelligence Agency, <i>The CIA World Factbook</i> , 2008 Edition
Political Empowerment	Ratio: Women with seats in parliament over male value	Inter-Parliamentary Union – <i>National Women in Parliaments</i> , July 2009 update or latest data available; United Nations Development Programme, Human Development Index 2008 Update or latest data available
	Ratio: Women at ministerial level over male value	Inter-Parliamentary Union, <i>E-Parliament Report</i> , 2008
	Ratio: Number of years with a female head of state or government (last 50 years) over male value	Own calculations, as of June 2009

Table 2: Calculation of weights within each subindex

Economic Participation and Opportunity Subindex	Standard deviation	Standard deviation per 1% point change	Weight
Ratio: Female labour force participation over male value	0.160	0.063	0.199
Wage equality between women and men for similar work (converted to female-over-male ratio)	0.103	0.097	0.310
Ratio: Estimated female earned income over male value	0.144	0.069	0.221
Ratio: Female legislators, senior officials and managers over male value	0.214	0.047	0.149
Ratio: Female professional and technical workers over male value	0.262	0.038	0.121
TOTAL			1
Educational Attainment Subindex	Standard deviation	Standard deviation per 1% point change	Weight
Ratio: Female literacy rate over male value	0.145	0.069	0.191
Ratio: Female net primary level enrolment over male value	0.060	0.166	0.459
Ratio: Female net secondary level enrolment over male value	0.120	0.083	0.230
Ratio: Female gross tertiary enrolment over male value	0.228	0.044	0.121
TOTAL			1
Health and Survival Subindex	Standard deviation	Standard deviation per 1% point change	Weight
Ratio: Female healthy life expectancy over male value	0.023	0.441	0.307
Sex ratio at birth (converted to female over male ratio)	0.010	0.998	0.693
TOTAL			1
Political Empowerment Subindex	Standard deviation	Standard deviation per 1% point change	Weight
Ratio: Women with seats in parliament over male value	0.166	0.060	0.310
Ratio: Women at ministerial level over male value	0.208	0.048	0.247
Ratio: Number of years of a female head of state (last 50 years) over male value	0.116	0.086	0.443
TOTAL			1

capturing the size and direction of the gender gap. This scale essentially penalizes either men's advantage over women or women's advantage over men, and gives the highest points to absolute equality. The second was a "one-sided" scale that measures how close women are to reaching parity with men but does not reward or penalize countries for having a gender gap in the other direction. Thus it does not reward countries for having exceeded the parity benchmark. We find the one-sided scale more appropriate for our purposes.

Calculate subindex scores

The third step in the process involves calculating the weighted average of the variables within each subindex to create the subindex scores. Averaging the different variables would implicitly give more weight to the measure that exhibits the largest variability or standard deviation. We therefore first normalize the variables in terms of equalizing their standard deviations. For example, within the educational attainment subindex, standard deviations for each of the four variables are calculated. Then we determine what a 1% point change would translate to in terms of standard deviations by dividing 0.01 by the standard deviation for each variable. These four values are then

used as weights to calculate the weighted average of the four variables. This way of weighting variables essentially allows us to make sure that each variable has the same relative impact on the subindex. For example, a variable with a small variability or standard deviation, such as primary enrolment rate, gets a larger weight within the educational attainment subindex than a variable with a larger variability, such as tertiary enrolment rate. Therefore a country with a large gender gap on primary education (a variable where most countries have achieved near-parity between women and men) will be more heavily penalized. Similarly, within the health subindex, in the case of the sex ratio variable, where most countries have a very high sex ratio and the spread of the data is small, the larger weight will penalize more heavily those countries that deviate from this value. Table 2 displays the values of the weights used in the Global Gender Gap Index 2006.⁵

Calculate final scores

In the case of all subindexes, the highest possible score is 1 (equality) and the lowest possible score is 0 (inequality), thus binding the scores between inequality and equality benchmarks.⁶ An un-weighted average of each subindex score is taken to create the overall Global Gender Gap

Index score. As in the case of the subindexes, this final value is bound between 1 (equality) and 0 (inequality), thus allowing for comparisons relative to ideal standards of equality in addition to relative country rankings.⁷ The equality and inequality benchmarks remain fixed across time, allowing the reader to track individual country progress in relation to an ideal standard of equality. Furthermore, we hope that the option of roughly interpreting the final Index scores as a percentage value that reveals how much of the gender gap a country has closed makes the Index more intuitively appealing to readers.⁸

The Global Gender Gap Index 2009 rankings

Country coverage

We aim to include a maximum number of countries in the *Report*, within the constraints posed by data availability. In 2009, over 200 countries were considered for inclusion. To be included in the *Report*, a country must have data available for a minimum of 12 indicators out of the 14 that enter the Index. There were 26 countries that had one data point missing but were included: Belize, Benin, Bolivia, Brunei Darussalam, Cameroon, Chad, Cuba, Egypt, Fiji, Ghana, Honduras, India, Iran, Jordan, Korea, Luxembourg, Malawi, Maldives, Mali, Singapore, Sri Lanka, Syria, Tunisia, Vietnam, Yemen and Zimbabwe. Another 15 countries had two data points missing but

were included: Albania, Angola, Bahamas, Belarus, Gambia, Guatemala, Guyana, Kenya, Kuwait, Moldova, Mozambique, Nigeria, Senegal, Tajikistan and Uzbekistan.

We were able to continue to report on the full set of 130 countries that were included in the 2008 edition. In addition, in 2009, we were able to include four new countries in the analysis: Bahamas, Fiji, Guyana and Senegal. This has increased our country coverage to a total of 134 countries this year.

Global patterns

The detailed rankings from this year's Index are shown in Tables 3 through 5.

Table 3a displays the 2009 rankings and provides comparisons with rankings in 2008, 2007 and 2006. Table 3b displays the complete 2009 rankings, including four subindex scores and ranks. Table 3c provides the year-to-year score changes over the last four years. Out of the 115 countries that have been covered in 2006, 2007, 2008 and 2009, 97 countries—over 80%—have improved their performance over the last four years, while 18 have shown widening gaps.

Figure 1 shows a global snapshot of the gender gap on the four subindexes. It shows that the 134 countries covered in the *Report*, representing over 90% of the world's population, have closed over 96% of the gap on health outcomes between women and men and almost 93% of the gap on educational attainment. However, the

Figure 1: Global patterns 2009

Source: Global Gender Gap Index 2009; scores are weighted by population.

Table 3a: The Global Gender Gap Index 2009 rankings: Comparisons with 2008, 2007 and 2006

Country	2009 rank	2009 score	2009 rank among 2008 countries	2008 rank	2008 score	2007 rank	2007 score	2006 rank	2006 score

gap between women and men on economic participation and political empowerment remains wide: only 59% of the economic outcomes gap and only 17% of the political outcomes gap has been closed.

Table 5 shows the performance of countries by subindex. In 2009, 25 countries have fully closed the gap on educational attainment, compared with 24 countries in 2008 and 15 in 2007. Thirty-nine countries have closed the gap on health and survival, compared with 36 in 2008 and 32 in 2007. Among these, 12 countries have closed the gap on both subindexes in 2009, 1 more than last year.

Regional trends

Figure 2 displays the regional performance on the overall index score, while Figures 3 through 6 display regional performance on each of the four subindexes.⁹ All scores were weighted by population to produce the regional averages. In the overall Index scores, Oceania continues to hold the top spot,¹⁰ followed closely by Western Europe and North America. All three regions have closed over 70% of the gender gap. They are followed by Latin America and Eastern Europe, each having closed over 67% of the gender gap. Sub-Saharan Africa and Asia come next, each region having closed around 65% of the gender gap. The Middle East and North Africa region occupies the last place, having closed approximately 58% of its gender gap.

Top 10

The four Nordic countries that have consistently held the highest positions in previous editions of the Global Gender Gap Index continue to flourish, but the top rankings have been reallocated. **Iceland** (1) claims the top spot from Norway (3), which slips to 3rd position behind Finland (2). Iceland, previously in fourth position, leaps forward this year to hold the number one spot in the 2009 rankings, becoming the country with the narrowest gender gap in the world. Iceland's improvement is characterized by small improvements in the economic participation and opportunity, educational attainment and political empowerment subindexes, resulting in a marked increase in the overall score. Most notably, the percentage of women in parliament increased from 33% to 43% and income and labour force participation gaps narrowed.

Finland (2) remains in 2nd position while improving its overall score. Finland continues to hold the number one spot on the health and survival and educational attainment subindexes but loses ground to Iceland on political empowerment despite the continued tenure of Tarja Halonen as Finland's first female president. **Norway**'s scores regressed for the first time in four years, causing it to lose the number one spot. While the percentage of women among professional and technical workers has tilted in favour of women—women now hold 51% of all such positions in the country—the percentage of women among legislator, senior official and managerial positions

has slipped from 34% to 32% according to the latest data available.

Sweden (4) completes the Nordic countries' continued dominance of the top four. With an impressive score, Sweden held the number one spot in 2006 and 2007, but since its gap is neither narrowing nor widening while other countries improve, last year it fell behind both Norway and Finland to 3rd place, and this year it loses one more rank to Iceland. The remaining Nordic country—**Denmark** (7)—continues to hold a place among the top 10, rounding off the Nordic countries' record as top performers. While no country has yet achieved gender equality, all of the Nordic countries, with the exception of Denmark, have closed over 80% of the gender gap and thus serve as models and useful benchmarks for international comparisons.

New Zealand (5) retains its privileged position in the rankings while showing an absolute increase in scores for economic participation (7) and political empowerment (7). **South Africa** (6) has made great strides in narrowing its gender gaps to enter the top 10. The latest data reveal that South Africa makes significant improvements in female labour force participation in addition to gains for women in parliament and in ministerial positions in the new government. **Ireland** (8) improves its performance relative to its own score in previous years but remains in 8th position in the relative rankings. The **Philippines** (9) also retains its privileged status in the top 10 as the highest-ranking Asian country, but for the first time in four years it slips in the rankings to 9th position. **Lesotho** (10) climbs six places to enter the top 10 for the first time, driven by large gains in the labour force participation of women and narrowing wage gaps, according to the latest data. Netherlands and Latvia, last year at 9th and 10th positions respectively, drop out of the top 10.

Europe

Six European countries are among the 10 highest ranked countries in the world, and 13 are among the top 20. These include the **Netherlands** (11), **Germany** (12), **Switzerland** (13), **Latvia** (14), the **United Kingdom** (15), **Spain** (17) and **France** (18), in addition to the five Nordic countries and Ireland.

Germany, which held 5th place in 2006, 7th place in 2007 and 11th place in 2008, falls in the rankings for the fourth consecutive year, despite minor improvements on economic and political participation. Switzerland continues its upward climb to gain another place in the rankings, based on improvements in economic participation and education, most notably through increases in women's estimated annual earned income and women's enrolment in tertiary education. The United Kingdom also slides in the rankings for the fourth consecutive year, moving from 13th place last year to 15th position in the 2009 rankings. Spain continues to hold 17th position while France slips three places to 18th position, due to

lower labour force participation of women in addition to increasing wage gaps.

Lithuania (30), **Belgium** (33), **Belarus** (34), **Moldova** (36), **Estonia** (37), **Bulgaria** (38), **Austria** (42), **Portugal** (46) and **Poland** (50) follow next in the rankings. Lithuania falls seven places this year because of a continued downward slide in the political empowerment subindex. Moldova loses 16 places because of widening gaps in education and economic participation.

The **Russian Federation** (51) loses nine places in the rankings compared with 2008 because of decreasing labour force participation of women and a perceived widening of the wage gap, although its overall ranking in the economic participation and opportunity category remains relatively strong at 24th place. However, in terms of political empowerment, the Russian Federation is far below average, holding the 99th position in the rankings for this subindex. **Slovenia** (52), **Macedonia** (53), **Croatia** (54), **Ukraine** (61), **Luxembourg** (63), **Hungary** (65), **Slovakia** (68) and **Romania** (70) follow next in the rankings.

Italy (72), **Czech Republic** (74), **Cyprus** (79) and **Greece** (85) remain the lowest-ranking European Union (EU) countries in the Index. Italy, the Czech Republic and Cyprus all lose ground, despite minor gains in economic participation, because of the faster progress of other countries. Greece, however, slips in the rankings because of its poor performance relative to its own scores in 2008, a drop driven mainly by losses in women's labour force participation as well as a decrease in the proportion of women among professional and technical workers.

Georgia (83), **Malta** (88), **Azerbaijan** (89), **Armenia** (90), **Albania** (91) and **Turkey** (129) round off the rankings for Europe. Turkey's performance in 2009 is worse than it was in 2008. Women's labour force participation slips from 29% to 26%, further opening the gap between women and men, although there are minor gains for women in leadership positions as the percentage of women among legislator, senior official and manager positions has risen from 8% to 10%.

North America

The **United States** (31) loses four places in the rankings this year. Labour force participation of women falls from 70% to 69% and the percentage of women among professional and technical workers falls from 57% to 56%. These losses offset the gains made in the estimated earned income of women and the percentage of women among legislators, senior officials and managers. While the overall score of the United States in political empowerment remained the same as previous years, as other countries make progress, the United States has slipped from 56th to 61st position on this subindex.

Canada (25) gains six places this year, moving ahead of the United States. Canada is now the 10th highest ranking country on the economic participation and

opportunity subindex. Women's labour force participation increased from 73% to 75% and women's estimated annual earned income increased from US\$ 25,448 to US\$ 26,055. Canada also posted gains in the political empowerment subindex as a result of a small increase in the percentage of women in parliament—21% to 22%.

Latin America and the Caribbean

Twenty countries in the Latin America and Caribbean region have fully closed their gender gaps in the health and survival subindex, and seven countries have fully closed gaps in educational attainment. The remaining gaps are thus most concentrated in the economic participation and political empowerment subindexes.

Once again, **Trinidad and Tobago** (19) holds the highest spot in the region. While there were improvements in female labour force participation rates (from 52% to 60%) and in perceived wage equality for similar work, other countries also made progress and thus Trinidad and Tobago continues to hold 19th place in the Index.

Barbados (21) and **Ecuador** (23) both show significant improvements in their rankings, particularly Ecuador, which moves up 12 places from 35th position. Both Barbados and Ecuador show overall improvements in the economic participation and opportunity subindex. Ecuador's leap in the rankings is further boosted by an increase in the number of women in parliament, which rose from 25% to 32%.

Argentina (24), previously the second highest ranking country in the region and now the fourth, displays a steady performance relative to its scores in 2008. Small losses in the economic participation and opportunity category are evened out by slight improvements in the political empowerment indicator.

Costa Rica (27) and **Cuba** (29) are next among this set of high-performing countries in the Latin American region. Despite showing favourable improvements in the labour force participation of women (from 97th to 93rd place), Cuba experiences a decline in the overall rankings (from 25th place in 2008 to 29th in 2009) because of a relatively large decrease in the number of female legislators, senior officials and managers according to the latest data, lowering the variable ranking from 31st to 62nd place.

Panama (43) and **Jamaica** (48) both fall in the rankings by nine and four places, respectively. In the case of Panama, this is brought on by a relatively large fall in the number of women in parliament—from 17% to 9%. In Jamaica, a very slight improvement in the economic participation and opportunity indicators does not prevent it from being overtaken by other countries in the Index. **Peru** (44) climbs four places this year, from 48th position. Peru's jump is primarily due to an overall improvement in all of the variables that make up the economic participation and opportunity subindex, which is only partially offset by a small decrease in the number of women in parliament (from 29% to 28%).

Nicaragua (49) makes one of the biggest leaps in the rankings this year, up from 71st place in 2008. This is the result of new data having become available for the economic participation and opportunity subindex, which more completely reflects the state of the economic gender gap in Nicaragua.

El Salvador (55) also shows small improvements due to increases in the estimated earned income of women (from US\$ 3,043 to US\$ 3,670) as well as a slight increase in the number of women in parliament (from 17% to 19%). **Colombia** (56) and **Uruguay** (57), which occupy the next two spots in the rankings, fall by six and three places, respectively. Colombia's fall can mainly be attributed to a perceived decline in the wage equality for similar work (from a ratio of 0.61 to 0.59—putting Colombia at 100th place on this variable) and estimated earned income (US\$ 5,680 to US\$ 4,898), although there is an increase in the labour force participation rates of women (67% to 69%). **Honduras** (62) suffers the largest drop of any country in the Latin America and Caribbean region. According to the latest data released, the labour force participation rate of women is 38%, significantly below the previous estimate of 58% in 2008.

Chile (64), **Paraguay** (66) and the **Dominican Republic** (67) follow—all three move up in the rankings. Chile's increase is driven by improvements in women's labour force participation rate (41% to 44%), increases in women's estimated earned income (US\$ 6,871 to US\$ 7,557) and a higher proportion of women among legislators, senior officials and managers. The Dominican Republic moves up five places in the rankings as a result of an increase in the latest estimates for female labour force participation (50% to 60%) as well as in wage equality for similar work (from a ratio of 0.56 to 0.66).

The most noticeable change, however, comes from **Paraguay** (66), which climbs in the rankings by 34 places, up from 100th position in 2008. This was partly due to an increase in the number of women in parliament (from 10% to 13%) and partly due to updated data for the professional and technical workers indicator, thus providing a more accurate picture of Paraguay's gender gap this year.

Suriname (78) experienced a very small improvement in its overall score. **Venezuela** (69) displays the second largest drop in the region, falling 10 places in the Index because of decreasing labour force participation of women—the latest data show that women's labour force participation is 55%, down from 64% in 2008. This is only partially offset by gains in women's estimated earned income. **Brazil** (81) falls by nine places because of a widening gap between women's and men's income—both perceived wage inequality for similar work (100th to 114th position) as well as estimated earned annual income (54th to 69th position).

Bolivia (82), **Belize** (87) and **Mexico** (98) all fall in the relative country rankings, although each country improves relative to its own performance in 2008. In the

case of Bolivia, there are small gains in the labour force participation of women and in the enrolment of girls in secondary school. Belize also posts gains in labour force participation rates (110th to 103rd). Mexico gains ground on wage equality for similar work (112th to 115th position), estimated earned income (108th to 106th position) and the number of women legislators, senior officials and manager (63rd to 51st position). These gains are offset by decreases in the political empowerment subindex, specifically a fall in the number of women occupying ministerial positions (from 16% to 14%).

Guatemala (111), the lowest-ranking country in the Latin America and Caribbean region, moves up one place this year because of improvements in the labour force participation rates (35% to 47%) as well as an increase in the enrolment rate of women in tertiary education (from 8% to 18%).

Middle East and North Africa

Israel (45) continues to hold the top spot in the Middle East and North Africa region and gains 11 places relative to its rank in 2008. This is mainly due to its significant improvement in the economic participation and opportunity subindex, particularly the proportion of women among legislator, senior official and managerial positions and gains in the perceived wage equality for similar work. Israel also gains ground on the political empowerment subindex because of an increase in the percentage of women in parliament, from 14% to 18%.

For the fourth consecutive year, **Kuwait** (105) holds the second spot in the region, favoured in particular by higher-than-average performances on educational attainment and health and survival. Compared with last year, however, Kuwait falls four places, which can be largely attributed to the latest data revealing that women's labour force participation is 44% (compared with 51% in 2008) and women's literacy rate is 91% (compared with 92% in 2008).

Kuwait is followed in the rankings by **Tunisia** (109), the **United Arab Emirates** (112), **Jordan** (113), **Bahrain** (116), **Algeria** (117), **Mauritania** (119), **Syria** (121), **Oman** (123), **Morocco** (124), **Qatar** (125), **Egypt** (126), **Saudi Arabia** (130) and **Yemen** (134). Most Middle East and North Africa region countries not only continue to perform far below the global average, but also do not show much improvement over the last year or have deteriorated. The exceptions are Israel, Bahrain, Algeria, Morocco, Egypt and Saudi Arabia, each of which has improved as compared with their absolute scores in 2008.

In the United Arab Emirates, which falls seven places this year, there are fewer women who are professional and technical workers (from 25% in 2008 to 21% in 2009) and the tertiary education enrolment rate of women dropped from 37% to 35%. Jordan falls nine places relative to its ranking in 2008, driven mainly by new data that show that the labour force participation rate of women is nearly half

of what was previously estimated (16% as compared with 30%). However, Jordan's drop in the relative rankings is also due to the significantly stronger performances of countries such as Guatemala, Nepal, Zambia and Angola.

Bahrain's improvements are mainly driven by significant improvements on women's economic participation. In Morocco, there are notable gains in the economic participation and opportunity subindex. Despite a loss in the relative rankings, Egypt makes impressive gains in the economic participation and opportunity subindex. Women's labour force participation is reported to have increased from 22% to 26%, women's estimated earned income has increased from US\$ 1,635 to US\$ 1,963 and the presence of women among professional and technical workers and among legislators, senior officials and managers has increased.

Saudi Arabia's gains in the economic participation of women are partially offset by revised estimates for educational attainment. Women's literacy rate is reported as 78% (as compared with 79% in 2008), girls' primary education enrolment is 84% (as compared with 87% in 2008) and secondary school enrolment is 72% (as compared with 76% in 2008). Women's tertiary education enrolment remains steady at 35%. Saudi Arabia remains the lowest-ranking country in the region on political empowerment.

Finally, Yemen continues to occupy the last place in the region as well as in the overall rankings of 134 countries. Yemen remains the only country in the world to have closed less than 50% of its gender gap, and it deteriorates further this year relative to its own performance in 2008.

It is notable that in Kuwait, Tunisia, the United Arab Emirates, Bahrain and Qatar, the tertiary education enrolment rates of women are higher than those of men. These economies have invested large amounts of resources in increasing women's education levels and will now need to better integrate these women into the economy to reap the benefits of this investment.

Asia and Oceania

The **Philippines** (9) and **Sri Lanka** (16) remain distinctive for being the only Asian countries among the top 20 for the fourth consecutive year. The Philippines is one of the two countries in Asia (along with Mongolia) to have closed the gender gap on both education and health and is among only twelve in the world to have done so. Despite continued gains in the area of political empowerment, the Philippines loses ground for the first time in four years and slips to 9th position, as other countries climbed faster up the rankings. The Philippines' gains in political empowerment are partially offset by a drop in women's labour force participation as well as in the perceived wage equality between women and men employed in similar positions. Sri Lanka (16) falls four places in the rankings, having been outperformed by South Africa, Lesotho and Switzerland, but its overall performance in 2009 has improved relative to its performance in 2008. Sri Lanka continues to hold a

privileged position, with the best performance in the region regarding political empowerment.

Mongolia (22) and **Kyrgyz Republic** (41) occupy the next highest ranks in Asia, followed by **Kazakhstan** (47) **Uzbekistan** (58) and **Thailand** (59). In addition to having no gaps between women and men on health and education indicators, Mongolia has a distinct advantage regarding economic participation and opportunity occupying the best place in the overall rankings of the 134 countries. However, its performance in political empowerment decreased over the last year.

While **China** (60) loses three places in the rankings, its absolute scores in economic participation and opportunity and educational attainment as well as health and survival increased. However, China continues to be one of the lowest-ranking countries on the health and survival subindex (130), the result of a disproportionate sex ratio at birth that contributes to China's "missing women" phenomenon.¹¹ While its overall absolute score increased, **Vietnam** (71) loses three places in the rankings.

Singapore holds the 84th position in the Index. **Tajikistan** (86) gains three places in the rankings, improving its scores in the labour force participation subindex. There is also a smaller perceived wage gap for similar work, according to the Executive Opinion Survey. **Indonesia** holds 92nd position in the 2009 rankings. Its scores in the economic participation and opportunity subindex, the political empowerment subindex and the educational attainment subindex all increase, but because of the better performance of other countries, Indonesia gained only one spot in the overall rankings. **Bangladesh** (93) follows just behind. **Brunei Darussalam** (94), which gains five places in the rankings, shows improvements in labour force participation. **Maldives** (99) falls eight spots this year because of losses in its political empowerment indicators. **Malaysia** holds the 100th position. Although **Japan's** overall score increased, it falls three places in the rankings (101). **Cambodia** holds the 104th position, followed by **Nepal** (110). Cambodia falls 10 places in the rankings because of a widening gap in labour force participation and a smaller percentage of women in parliament. Finally, **India** (114), **Korea** (115), **Iran** (128) and **Pakistan** (132) continue to hold some of the lowest positions in the Asian rankings. While India, Iran and Pakistan perform very poorly in the economic, education and health subindexes, their overall scores are partially bolstered by relatively good performances on political empowerment.

New Zealand (5) and **Australia** (20) continue to perform well in the rankings. Both countries have fully closed the gap in the educational attainment subindex and both perform well in economic participation indicators. New Zealand makes gains in scores for economic participation and political empowerment, while Australia improves economic participation and opportunity scores, in particular because of improved labour force participation and narrowing wage gaps—Australia is now among

the top 10 countries on the estimated earned income gaps indicator.

Sub-Saharan Africa

South Africa (6) takes back the top spot in the region after having lost it last year. The latest data reveal that South Africa made significant improvements in female labour force participation in addition to gains for women in parliament and in ministerial positions in the new government. South Africa holds the top spot of the region in political empowerment. It is followed by **Lesotho** (10) as the only other African country in the top 20. Lesotho, which gains six places, is once again the only country from the region to have no gap in education and health. Lesotho's female labour force participation increases from 49% to 69% according to the latest data made available by the International Labour Organization (ILO).

Mozambique (26) and **Namibia** (32) follow next. **Botswana** moves up in the rankings, from 63 to 39. This is mainly because of a major increase in economic participation and opportunity—the ILO's new data provide the most up-to-date information on this country. In **Uganda** (40), the female-to-male ratio of the number of women in legislators, senior officials and managers rises from 0.16 to 0.50. **Tanzania** (73) loses 35 places in the rankings in 2009, mainly because the latest data reveal a worsening gap in the economic participation and opportunity subindex. **Gambia** (75) moves up in the rankings because of improvements in its women's labour force participation. In **Malawi** (76), the number of women in parliament increases from 13% to 21%, boosting its overall score.

Malawi is followed in the rankings by **Madagascar** (77), **Ghana** (80), **Zimbabwe** (95) and **Mauritius** (96). **Kenya** (97) loses nine places in the rankings this year. This is the result of several changes, but primarily the lower participation of women in the labour force. In 2009, we were able to include one more country from the region—**Senegal**—which enters the rankings at 102nd position. **Angola** (106) moves up in the rankings, gaining eight places. The significant increase in the proportion of women in parliament (from 15% to 37%) offsets the widening gap in terms of economic participation. **Zambia** lies in 107th position in the Index, followed by **Nigeria** (108). Nigeria slips down six spots relative to its performance last year, the result, among other factors, of a widening wage gap.

The performance of **Cameroon** (118) remains largely unchanged. **Mauritania** (119) loses nine places, partially because of a decrease in the enrolment of women in secondary education as well as the relatively more significant achievements of other countries regarding economic participation and opportunity and political empowerment. Mauritania is followed by **Burkina Faso** (120) and **Ethiopia** (122). **Mali** (127) slips down 18 places because of the deteriorating economic participation of women and widening wage gaps. **Benin** (131) and **Chad** (133)

continue to occupy some of the lowest positions in the rankings.

The link with the economic performance of countries

The most important determinant of a country's competitiveness is its human talent—the skills, education and productivity of its workforce. And women account for one-half of the potential talent base throughout the world. Over time, therefore, a nation's competitiveness depends significantly on whether and how it educates and utilizes its female talent. To maximize its competitiveness and development potential, each country should strive for gender equality—that is, to give women the same rights, responsibilities and opportunities as men. Figure 7 shows a plot of the Global Gender Gap Index 2009 scores against the Global Competitiveness Index 2009–2010 scores, while Figure 8 plots the Global Gender Gap Index 2009 scores against GDP per capita. We have produced these graphs in all previous editions of the *Report*; both graphs once again confirm the correlation between gender equality and the level of development of countries. The correlation is evident despite the fact that, as opposed to other gender indexes, the Global Gender Gap Index explicitly eliminates any direct impact of the absolute levels of any of the variables (e.g., life expectancy, educational attainment, labour force participation) on the Index. While correlation does not prove causality, it is consistent with the theory and mounting evidence that empowering women means a more efficient use of a nation's human talent.

Numerous studies during the last decade have confirmed that reducing gender inequality enhances productivity and economic growth. Research demonstrates that investment in girls' education reduces female fertility rates, lowers infant and child mortality rates, lowers maternal mortality rates, increases women's labour force participation rates and earnings and fosters educational investment in children.¹² All of these outcomes not only improve the quality of life, they also foster faster economic growth. The economic benefits of scaling back barriers to women's engagement in the workforce can be also substantial. For example, a report by the United Nations Economic and Social Commission for Asia and the Pacific Countries found that restricting job opportunities for women is costing the region between US\$ 42 and US\$ 46 billion a year. Research by the World Bank demonstrates that similar restrictions have also imposed huge costs throughout the Middle East, where decades of substantial investment have dramatically reduced the gender gap in education and health but the gender gap in economic opportunity remains the widest in the world, with only about one-third of women participating in the workforce. The benefits of greater economic opportunity for women are certainly not limited to developing countries. For example, according to recent research, a reduction in the male–female employment gap has been an important driver of European economic growth in the last decade.¹³ And clos-

ing this gap would have huge economic implications for the developed economies, boosting US GDP by as much as 9%, Eurozone GDP by as much as 13% and Japanese GDP by as much as 16%. Reducing gender inequality in these countries could play a key role in addressing the future problems posed by ageing populations and mounting pension burdens. Moreover, these results confirm that in countries in which it is relatively easy for women to work and to have children, female employment and female fertility both tend to be higher.

Over the past few decades, both developed and developing countries have made substantial progress in educating women and improving their health outcomes. In many developed countries, women now account for more than half of the college and university graduates, and many developing countries have dramatically reduced gender gaps in literacy and primary/secondary education. Yet even in developed countries whose dependence on knowledge industries and knowledge workers is large and growing, there are still significant gaps in the job opportunities for women and in the wages paid to women compared with their male counterparts, and these gaps are even larger in most developing countries. Innovation requires new, unique ideas—and the best ideas flourish in a diverse environment. This implies that companies benefit by successfully integrating the female half of the available talent pool across their internal leadership structures. Studies exploring this link have shown a positive correlation between gender diversity on top leadership teams and a company's financial results.¹⁴

Over the last year, in the midst of the global economic downturn, several new themes have emerged, particularly in the media, on gender equality and its economic impact. First, there has been much discussion around the differences between women and men in their decision-making processes as well their propensity for risk-taking. Biologists, behavioural economists and psychologists have all contributed to discussions on whether women's perceived propensity for taking more inclusive, informed decisions and engaging in less risky behaviour might not have prevented some of the poor decisions and the excesses that led to the current financial crises. There have also been several national studies exploring whether, proportionally, women or men have been harder hit by the crisis—among other factors, this has been a function of the type of industries that have been most affected. Recent studies are also revealing that female employees have almost twice the flight risk in the current environment that men have,¹⁵ and businesses may neglect these risks. There has also been speculation on whether aid that supports women and girls, particularly in relation to the Millennium Development Goals, will be reduced as a result of the downturn and its negative impact on gender disparities (for more information on girls' education and maternal health please refer to Appendixes D and E). Finally, there has also been new research on how the growing “power of the purse” will be

Figure 7: Relationship between the Global Competitiveness Index 2009–2010 and the Global Gender Gap Index 2009 scores

Source: Global Gender Gap Index 2009 and Global Competitiveness Index 2009–2010.

among the drivers of growth in the post-crisis economy. The combined impact of growing gender equality, the emerging middle class and women's spending priorities will lead to rising household savings rates and shifting spending patterns that are likely to benefit sectors such as food, healthcare, education, childcare, apparel, consumer durables and financial services, particularly in emerging markets.¹⁶ The study predicts that over the next five years, the effects of the growing power of the purse will be seen most clearly in China and Russia, and to a lesser extent in Vietnam, Mexico, Brazil and Indonesia. In the subsequent decade (2015–25), these dynamics are likely to remain strong in Mexico and Russia, and to continue to strengthen in China, Indonesia, Vietnam, India and the Philippines. India's middle class will see rapid growth off a very low base, but the shifts in spending that we outline are likely to remain constrained by women's relatively low status, at least for the next 10 to 15 years.

In the current situation, when funds are limited and resources must be used as efficiently as possible, it is worth considering investments or policies that are likely to bring the greatest returns. A substantial body of literature has already shown that investing in girls' education has significant multiplier effects on family incomes, infant and child health, maternal mortality and community well-being. Investing in girls' education remains one of the highest-return investments that a developing economy can make and, in the current environment, may be among the best use of limited funds. It has also been shown through our own research as well as that of others that the current

economic participation of women, even in countries where they are as healthy and as educated as men, is far from optimal. Talent and human capital are fundamental to economic growth—ensuring that barriers to women's entry to the workforce are removed and that equal opportunities are provided for rising to positions of leadership within companies are among the key factors for business leaders and policy-makers to consider to ensure that all existing resources are used in the most efficient manner and to send the right signals to ensure the optimal flow of future talent.

Tracking the gender gap over time: How fast are gender gaps closing?

The Global Gender Gap Index was first published in 2006. Based on the four years of data available for the 115 countries that have been part of the *Report* since its inception, we find that on the whole the world has made progress on closing gender gaps. Figure A1 in Appendix A displays changes over time within the four subindexes, while Figure A2 displays changes over time across different regions. In 2006, 14% of the global political empowerment gap had been closed; in 2009, almost 17% of this gap has been closed. In 2006, 56% of the economic participation gap had been closed; in 2009, more than 59% of this gap has been closed. In 2006, almost 92% of the educational attainment gap had been closed; in 2009, over 93% of this gap has been closed. On health and survival, however, there has been a small deterioration between 2006 and 2009. All eight regional categories have displayed improve-

Figure 8: Relationship between GDP per capita and the Global Gender Gap Index 2009 scores

Source: Global Gender Gap Index 2009 and the IMF's *World Economic Outlook Database* (April 2009), available at www.imf.org/weo. Luxembourg was removed from this graph.

ment over the last four years on the overall Index score. The largest strides have occurred in Asia, followed by Western Europe, Latin America and the Caribbean, sub-Saharan Africa, Oceania, Middle East and North Africa, Eastern Europe and finally North America.

For a longer-term look at trends, we were able to calculate the Global Gender Gap Index backwards to the year 2000 for a limited set of countries. Table A1 in Appendix A displays the Global Gender Gap Index 2000–2009 for 40 countries where the relevant data was available. In all countries there was a net improvement in scores across the nine years. In Belgium, Chile, Costa Rica, El Salvador, Finland, Ireland, Italy, Netherlands, Panama, Slovenia, Spain, Sweden, Switzerland and Trinidad and Tobago, this amounted to increases of 10% or above relative to their initial scores in the year 2000. Australia, Bangladesh, Denmark, Greece, Iceland, Japan, Korea, Latvia, Mexico, New Zealand, Norway, Portugal and Turkey posted gains of between 6% and 9% above their original scores in the year 2000. Finally, in Canada, Colombia, Croatia, Czech Republic, Hungary, Israel, Malaysia, Poland, Romania, Slovak Republic, Slovenia and the United Kingdom, improvements have ranged between 1% and 5% of the original score.

In a special section this year, Ricardo Hausmann and his colleagues explore the dynamics of the gender gap in Box 1 and Appendix C.

Conclusion

The fourth edition of *The Global Gender Gap Report* calls attention to four essential facts. First, the Index provides a valuable snapshot of the current performance of 134 countries, representing over 90% of the world's population. On average, over 96% of the gap on health outcomes, 93% of the gap on educational attainment, 60% of the gap on economic participation and 17% of the gap political empowerment has been closed. No country in the world has achieved gender equality. The three highest-ranking countries—Iceland, Finland and Norway—have closed a little over 80% of their gender gaps, while the lowest ranking country—Yemen—has closed only around 46% of its gender gap.

Second, this *Report* highlights the potential use of the Index as a tool for tracking gender gaps by beginning to reveal how these gaps are evolving over time. It brings to light the collective progress made over the past four years. Out of the 115 countries covered in 2006, 2007, 2008 and 2009, 98 countries (more than 85%) have improved their performance, while 17 countries (15%) have widening gaps. In 2009, 25 countries have fully closed the gap on educational attainment as compared with 24 countries in 2008 and 15 in 2007. On the health and survival subindex, 39 countries have fully closed the gap, compared with 36 last year and 32 in 2007. Among these, 12 countries have closed the gap on both subindexes, 1 more than last year. Progress is possible and, in some of those countries where it is taking place, it is occurring in a relatively short time. Analysis using census data for a limited set of countries

Box 1: The dynamics of the gender gap: How do countries rank in terms of making marriage and motherhood compatible with work?

By **RICARDO HAUSMANN**, **INA GANGULI** and **MARTINA VIARENGO**

Harvard University, John F. Kennedy School of Government

The education gap between women and men has been eliminated in many countries. However, in most countries women participate less in the labour market than men. This is in part related to women's roles in marriage and motherhood. In this box, we look at education and employment gaps and calculate marriage- and motherhood-related employment gaps for women. We also analyse how quickly these factors have changed over time and rank countries accordingly.

The gender gaps in a country are bound to evolve slowly over time as successive cohorts go through the educational system, reach working age, and make marriage, fertility and labour force participation decisions. It is therefore instructive to look at these issues in a way that is sensitive to the life cycle. Moreover, it is important not only to rank the level of gender gaps in different countries, but also to measure the speed at which different countries are closing these gender gaps over time. In this box, and in Appendix C, we use national census data to shed light on the dynamics of the gender gap by analysing changes in measures of men's and women's average levels of education and labour force participation for different cohorts of individuals. We also look at how marriage and fertility decisions have affected women's employment over time. This more detailed look at the issues with census data comes at a significant cost. First, we have been able to carry out the analysis only for a much smaller set of countries: there are 41 countries for which we have at least one census and 29 countries for which we have two (see Table C1). Using two censuses allows us to measure speed of progress by comparing the gender gaps for the same age group for a later and more recent time period. Second, this approach limits our capacity to measure gender gaps for very recent years, as censuses are typically carried out once per decade. In fact, many of the censuses to which we have access are approximately a decade old. In spite of these caveats, we believe that this analysis provides interesting insights into the magnitude and dynamics of the gender gap.

The data

Data for the analysis come from the International Integrated Public Use Microdata Series (IPUMS-International). Compiled by the Minnesota Population Center, the IPUMS data include the largest publicly available individual-level census data, and consist of decennial records of persons and households. Data for select countries from Africa, Asia, Europe and Latin America between 1960 and 2005 are used as available. Table C1 in Appendix C lists the countries and the census years used. In the framework of our analysis, two analytical samples have been constructed. The first sample includes the most recent wave of the survey for each country. It includes 41 countries from the 5 continents. We use this sample to examine the current state of the gender gaps across countries. The second

sample of data includes 29 countries for which we have the two most recent waves of the census available. Using two waves, we study trends related to the gap in labour force participation and indicators related to work and family.

The gender gap in education

Table C2 in Appendix C ranks countries according to the year of birth of the cohort in which the education gender gap reversed, where the *gender gap* is defined as the average years of education among men minus the average years of education among women born in a given year. We also include information on the size gender gap for the population aged 25 years of age at the date of the last census.

Of the 41 countries included in our sample, 27 have already closed the education gap, so that men and women on average have the same number of years of schooling. The first country to reverse the gap was Belarus for the cohort born in 1945, while the last was Romania, indicating that the closing of the gender gap was not a common feature of former Communist countries. Interestingly, several developing countries—such as Argentina, Colombia, Panama, Brazil, the Philippines, Mongolia, Venezuela, Armenia and the Kyrgyz Republic—closed their education gender gap before the United States. These cohorts are already over 50 years old at present, so these countries already have two generations in which women received at least as much education as men. The most recent countries to close the gap have been Chile, Malaysia, Ecuador, Jordan, Vietnam, South Africa and Romania; these countries have achieved this benchmark for cohorts currently in their 30s.

Of the 13 countries that have yet to close the education gap, two have a very small remaining gap: Mexico and Austria, with the cohort of those 25 years of age exhibiting gaps of 0.1 years of schooling. By contrast, other countries still have substantial gaps, such as Ghana, Uganda, Cambodia, India, Guinea, Bolivia and Iraq, in which 25-year-old men still have at least 1 year more of schooling than women on average. Rwanda, Kenya, Palestine and China show gaps in the range of 0.6 to 0.8 years of schooling.

The labour force participation gap

We study the gap in men's and women's labour force participation by looking at the cohort of men and women between 35 and 44 years of age, the age at which labour force participation typically peaks. The gap is defined as the share of men who are in the labour force (employed or unemployed and seeking work) minus the share of women who are in the labour force. We find that in Rwanda, women's labour force participation in this age group is higher than men's. Considering that this cohort would have been 20 to 29 years of age during the Rwandan genocide, it is interesting to consider how that circumstance might have affected relative mortality and gender roles for this cohort. Belarus again appears near the top of the ranking with essentially no participation gap. Countries with participation gaps

(Cont'd.)

Box 1: The dynamics of the gender gap: How do countries rank in terms of making marriage and motherhood compatible with work? (cont'd.)

below 10% include Ghana, Hungary, Mongolia, the Kyrgyz Republic and China. By contrast, the largest participation gaps—in excess of 60 percentage points—are in three Arab countries, namely Jordan, Iraq and Palestine. Countries where the gap exceeds 40% include Venezuela, Colombia, Panama, Chile, the Philippines, Ecuador, Mexico, Malaysia, India and Costa Rica.

We also explore the evolution of the participation gap over time in the decade between the two last censuses. Spain and Brazil show the fastest reduction in the participation gap, with reductions in excess of 20 percentage points, representing over 40% of the gap as measured a decade earlier. These are followed by Israel, Greece, Venezuela, Portugal, Argentina, Austria and Colombia, all with reductions of 10 percentage points or more. By contrast, Vietnam, Romania, Mexico, South Africa and the United States show rising participation gaps over the decade prior to the last census.

These dynamics are presented in Figure C1 in Appendix C as a graph relating the initial gender participation gap on the horizontal axis and the decade change in the gap on the vertical axis. Here we find that quite a few countries had a gap in excess of 40% in the previous census, while another group had gaps of less than 20%. In general, those that started with small gaps saw small declines or even some increases (e.g., Vietnam, Romania and the United States). Of the countries that started with large gaps, the subsequent behaviour is much more varied, with Brazil, Spain, Israel and Greece drastically reducing their large gaps, others reducing it much more moderately and Mexico increasing it significantly.

Work and marriage

Next, we explore the impact of marriage, whether legal or informal, on women's employment rates. We want to know to what extent family life is compatible with work in the labour market. We define the *marriage gap* as the difference in the employment rates of married and single women. We look again at the cohort in the prime of their working age, namely 35 to 44 years old. The data are presented in Figure C2 in Appendix C.

We find that there are three types of countries. In some countries, female employment is high, roughly over 60%, and differences in employment rates between married and single women are small, approximately less than 10%. In some countries—such as Mongolia, Ghana, China, Slovenia, the UK, Hungary, Rwanda, Belarus, Canada and Romania—married women work more than single women. There is a second group of countries where participation is between 40% and 60% and the difference between married and single is much larger and more heterogeneous. The largest gaps among this group of countries are in Mexico, Malaysia, Costa Rica, the Philippines, Colombia, Chile, Panama, Ecuador and Venezuela, while small gaps are seen in South Africa, Israel and Armenia. However, in this group it is clear that as female labour force participation rises there tends to be a decline in the marriage gap. A third group of countries is composed of those where female labour force participation is less

than 20%. This group is composed of four Arab countries, three of which have the largest gaps between single and married women (Iraq, Jordan and Palestine) while one has fairly moderate differences (Egypt).

Figure C3 in Appendix C shows the evolution of the marriage gap over time. It plots the marriage gap between single and married women in the previous census against the change in the gap between the last two censuses. We normalize the speed on a per decade basis. The graph shows that countries that started with small gaps had small changes; some with small increases such as the United States, Vietnam, Rwanda, Ghana, China and Kenya saw small increases in the gap, and others show small decreases (e.g., the United Kingdom, Hungary, Canada and Romania). By contrast, those that started with large gaps show a more heterogeneous picture: Argentina, Brazil and Spain and to a lesser extent Greece and Israel started with large gaps but reduced them at a very fast pace, but other countries with equally large initial gaps saw much slower reductions (Chile, Ecuador, Venezuela, India, Colombia and Panama) or actual deteriorations (Costa Rica, Malaysia and Mexico).

Motherhood and employment

Here we study to what extent motherhood is compatible with employment. We compare the difference in the employment rate of women working within the ages of 35 and 44 by comparing those with three children to those with no children, which we will call the *motherhood gap*. We find (Figure C4 in Appendix C) that countries differ quite significantly in this dimension. In quite a few countries, women with three children show a higher employment rate than women with no children. This occurs in countries with moderate employment rates among women with no children (e.g., Rwanda, Kenya, Ghana, Vietnam, Uganda, China, Belarus, Israel, Guinea, South Africa, the Kyrgyz Republic and Cambodia) but also in countries with very low female employment rates such as Iraq and Palestine.

By contrast, the country with the largest motherhood gap is Chile, where women with three children are 43% less likely to work than women with no children. Other countries with big gaps include Argentina, Mexico, Colombia, Ecuador, Austria, Hungary and the Philippines.

Countries also differ significantly in the rate at which they have been reducing the motherhood gap (Figure C5 in Appendix C). Austria, Brazil, Greece and Bolivia top the ranking with reductions in the motherhood gap of 9 to 11 percentage points. By contrast, Hungary moved in the opposite direction with a gap that widened by 11 percentage points, followed by Romania and Costa Rica with 6 percentage points.

Conclusion

Our analysis of national census data reveals that there are differences in both the magnitudes of gender gaps around the world

(Cont'd.)

Box 1: The dynamics of the gender gap: How do countries rank in terms of making marriage and motherhood compatible with work? (cont'd.)

and the speed at which countries are closing gender gaps over time. Although this detailed analysis of census data has been limited to a smaller set of countries, it has been sensitive to changes in decisions individuals make about education, employment, marriage and fertility across cohorts. First, we see that over half of the countries in our sample have closed the gender education gap. Interestingly, several developing countries closed the education gap for cohorts currently in their 50s, some of them even before the education gap was closed in the United States. Second, we see that a gap in men's and women's labour force participation exists in many countries, with the smallest gap in Rwanda and the largest gaps in the Arab countries in our sample. Some of those that started with large gaps over a decade ago—notably Spain, Brazil, Greece and Israel—have narrowed their gaps remarkably quickly. By contrast, Mexico, which started in a similar position, has seen a widening gap. For countries that began with small initial labour force participation gaps, the declines in the gap over time are small or even increasing, as in the United States.

Whether women participate in the labour market depends on how compatible marriage and motherhood are with employment. We find that in countries where female labour force participation is high, married women work almost as much, if not more, than single women. By contrast, Arab and Latin American countries show large marriage gaps. Progress in closing this marriage gap has been fastest in the same four countries: Brazil, Spain, Greece and Israel, together with Argentina. In some countries, the employment gap has been rising, with the biggest rise found in the United States.

Motherhood has not been a universal obstacle for female labour force participation. In almost half the countries we studied, women with three children work at least as much as women with no children. However, in other countries, especially in Latin America, the motherhood gap is very large, with Chile exhibiting the largest gap. But there is good news: the motherhood gap has been falling in almost two-thirds of the countries, with the biggest reductions shown again by Brazil and Greece, accompanied by Austria and Bolivia.

In synthesis, while the education gap has been reversed in quite a few countries, the employment gap has not. This gap is related to the compatibility of marriage and motherhood with a lifestyle where women can work. Some countries have made enormous progress in this area. We should learn more from them.

reveals that although the education gap has been reversed in quite a few countries, the employment gap has not—this gap is related to the compatibility of marriage and motherhood with a lifestyle where women can work. Some countries—for example, Brazil, Spain, Greece and Israel—have made enormous progress in this area.

Third, the Index points to potential role models by revealing those countries that—within their region or their income group—are leaders in having divided resources equitably between women and men, regardless of the overall level of resources available. In Europe, the Nordic countries come out on top; in North America, Canada now leads the way; in Latin America and the Caribbean, Trinidad and Tobago is the best performer; in the Middle East and North Africa, Israel holds the top position; in Asia, the Philippines; and in sub-Saharan Africa, South Africa holds the highest ranking. Among income groups, in the high-income group, the Nordic countries lead the way; in the upper-middle-income group, South Africa and Latvia rank highest; in the lower-middle-income group, the Philippines comes out on top; and in the lower-income group, Mozambique is the strongest performer. The detailed Country Profiles allow users to understand not only how close each country lies relative to the equality benchmark in each of the four critical areas, but also provide a snapshot of the legal and social framework within which these outcomes are produced.

Fourth, the Index continues to track the strong correlation between the gender gap and national competitiveness and sends a clear message to policy-makers to incorporate gender equality into their national priorities. The most important determinant of a country's competitiveness is its human talent—the skills, education and productivity of its workforce—and women account for one-half of the potential talent base throughout the world. Over time, therefore, a nation's competitiveness depends significantly on whether and how it educates and utilizes its female talent. To maximize its competitiveness and development potential, each country should strive for gender equality—that is, to give women the same rights, responsibilities and opportunities as men. In the context of the current economic crisis, it is more vital than ever that women's economic participation does not shrink, but is in fact seen as an opportunity to make headway. The minds and talents of both women and men will be vital to making a rapid recovery.

Addressing both the challenges and opportunities associated with the gender gaps will require concerted efforts by governments, businesses and civil society organizations across the world. In addition to these specific efforts, best practice exchange, partnerships and collective problem-solving among these groups will be crucial. Future research will be needed to develop a clearer understanding of the policies that are successful and those that are not. We are hopeful that this *Report*, by providing a transparent

and comprehensible framework for assessing and tracking global gender gaps, will serve as a catalyst for greater awareness, future research and targeted action by policy-makers, employers and civil society.

Notes

- 1 See Greig et al. "The Gender Gap Index 2006: A New Framework for Measuring Equality", *Global Gender Gap Report 2006*. Geneva: World Economic Forum.
- 2 This ratio is based on what is considered to be a "normal" sex ratio at birth, 1.06 males for every female born. See Klasen and Wink, "Missing Women: Revisiting the Debate".
- 3 This ratio is based on the standards used in the UN's Gender-Related Development Index, which uses 87.5 years as the maximum age for women and 82.5 years as the maximum age for men.
- 4 A first attempt to calculate the gender gap was made by the World Economic Forum in 2005; see Lopez-Claros and Zahidi, *Women's Empowerment: Measuring the Global Gender Gap*. The 2005 Index, which was attempting to capture women's empowerment, used a "feminist" scale that rewarded women's supremacy over men (highest score is assigned to the country with the biggest gap in favour of women).
- 5 The weights derived for the 2006 Index were used again this year and will be used in future years to allow for comparisons over time.
- 6 This is not strictly true in the case of the health variable, where the highest possible value a country can achieve is 0.9796. However, for purposes of simplicity we will refer to this value as 1 throughout the chapter and in all tables, figures and country profiles.
- 7 Because of the special equality benchmark value of 0.9796 for the health and survival subindex, it is not strictly true that the equality benchmark for the overall index score is 1. This value is in fact $(1 + 1 + 1 + 0.9796) / 4 = 0.9949$. However, for purposes of simplicity, we will refer to the overall equality benchmark as 1 throughout this chapter.
- 8 Since the variables in the subindexes are weighted by the standard deviations, the final scores for the subindexes and the overall Index are not a pure measure of the gap vis-à-vis the equality benchmark and therefore cannot be strictly interpreted as percentage values measuring the closure of the gender gap. However, for ease of interpretation and intuitive appeal, we will be using the percentage concept as a rough interpretation of the final scores.
- 9 A population-weighted average of all scores within each region was taken to produce these charts.
- 10 For details of the regional classifications, please refer to Appendix B of this chapter.

Appendix A: A Historical Perspective

The four-year dataset for the Global Gender Gap Index generally indicates progress across regions and across the four subindexes (see Figures A1 and A2). Table A1 presents the overall historical Index results. For a more detailed analysis by subindex and trends in the health and education subindexes, please refer to the Global Gender Gap Index 2007.

Figure A1: Global Gender Gap Index by subindex, 2006–2009

Source: Global Gender Gap Indexes, 2006–2009; scores are weighted by population. Population data from World Bank's *World Development Indicators* online database, 2005, 2006 and 2007, accessed June 2009.

Figure A2: Global Gender Gap Index by Regions, 2006–2009

Source: Global Gender Gap Indexes, 2006–2009; details of regional classifications can be found in Appendix B.

Table A1: Overview of historical data scores, 2000–2009 (selected countries)

Uganda	n/a	1.6
Ghana	n/a	2.1

Note: The United Kingdom has been excluded because data are missing for individuals aged 25.

Figure C1: Change in the gender labour force participation gap from previous to latest census vs. the initial gap

Note: Gender gap in labour force participation, previous census, shows the difference between men's and women's labour force participation, for men and women aged 35–44. The change in the gender gap in labour force participation is the percentage change in gender gap in labour force participation between the last two censuses, for men and women aged 35–44.

Figure C2: Female employment rate vs. ratio of married to single employment rate

Note: The female employment rate is the share of working women for women aged 35–44. The ratio of married to single women employment rate is the ratio of the share of married women working relative to the share of single women working for women aged 35–44.

Figure C3: Change in the marriage gap from previous to latest census vs. the initial gap

Note: The marriage gap, previous census is the labor force participation gap between single and married women, for women aged 35–44. The change in the marriage gap is the percentage change in marriage gap between the last two censuses, for women aged 35–44. As explained in Box 1, *married women* are defined as women who are legally married and in a consensual union.

Figure C4: Motherhood gap vis-à-vis employment rate for women with no children

Note: The employment rate for women with no children is the share of working women with no children, women aged 35–44. The motherhood gap is the difference in the share of women working found by comparing those with three children with those with no children, for women aged 35–44.

Figure C5: Change in the motherhood gap by number of children from previous to latest census vs. the initial gap

Note: The motherhood gap, previous census is the difference in the share of women working found by comparing those with three children with those with no children, for women aged 35–44. The change in the motherhood gap is the percentage change in motherhood gap between the last two censuses, for women aged 35–44.

In the Millennium Declaration of September 2000, Member States of the United Nations made a commitment to eliminate gender disparity in all levels of education no later than 2015.

Education gaps

- Out of the 134 countries covered by this *Report*, 82 countries have fully achieved gender parity in primary enrolment, another 41 have closed between 90% and 99% of the gap and another 9 countries—the majority located in sub-Saharan Africa—are far below parity.
- Countries with large disparities in favour of boys in primary education further accentuate these in secondary education, whereas countries very close to parity tend to close the gap or reinforce the female advantage in secondary education.
- Net enrolment is actually decreasing even though the overall numbers went up. There are more children in school but there are also more children out of school. With the annual growth of the school-age population there are not enough schools.¹
- It is important to stress that the failure to educate girls can be overlooked when reviewing the data. Girls are often “invisible”—not reported or under-reported.²
- Where there is parity in enrolment, there is often a disparity in education quality.³
- Today, more than one-quarter of the population in sub-Saharan Africa, Asia, the Caribbean and Latin America are girls and young women ages 10 to 24.⁴ Out of the world’s 130 million out-of-school youth, 70% are girls.⁵ Recent global estimates indicate that more than 100 million girls are involved in child labour,⁶ such as domestic service or farm work.
- As a result of the current crisis, younger girls are being pulled out of school and sent to work to earn money for their families. This is a financial disaster for struggling economies.⁷
- Many experts acknowledge that when schools charge fees for school, poor parents may choose to send only the boys or to opt out entirely.⁹
- Girls’ access to education may also be limited by other factors, such as the safety of the journey to school or lack of adequate water.¹⁰
- 82 million girls in developing countries who are now between the ages of 10 and 17 will be married before their 18th birthday.¹¹ One-quarter to one-half of girls in developing countries become mothers before 18.¹²
- Women who have been educated are less likely to die during childbirth because they tend to have fewer children, better knowledge of health services during pregnancy and birth and improved nutrition.¹³ It is also estimated that one year of female schooling reduces fertility by 10%.¹⁴
- Early marriage massively impedes the educational progress of girls, whether it occurs to lighten a family’s economic burden or to secure a daughter’s future.¹⁵

Girls’ education and its multiplier effects

- Enhanced economic development: Decades of research have found an important link between the expansion of basic education and economic development. Education has a positive influence in a child’s life, from health to protection from HIV/AIDS, exploitative labour and trafficking.¹⁶ Girls’ education has an even more positive effect.¹⁷ Girls’ education yields some of the highest returns of all development investments, yielding both private and social benefits that accrue to individuals, families and society at large.¹⁸
- Enhanced income: Every year of schooling increases a girl’s individual earning power by 10% to 20%, while the return on secondary education is even higher, in the 15% to 25% range.¹⁹ Additionally, women reinvest 90% of their income back into the household, whereas men reinvest only 30% to 40%.²⁰
- Education for the next generation: Educated girls who become mothers are more likely to send their children to school, passing on and multiplying benefits. This breaks the intergenerational chain of poverty.

Barriers to girls’ education

- According to the UN, sanitation improvements are a major reason behind female school enrolment increases in Guinea, Nigeria, and other countries.⁸

- Healthier families and communities: Children of educated mothers have higher survival rates and tend to be healthier and better nourished.²¹
- 75% of all HIV infections in sub-Saharan Africa among people ages 15 to 24 are young women.²² In the absence of a vaccine protecting children and young people against HIV/AIDS, education is the best defence against the disease. The more educated and skilled, the more likely they are to protect themselves from infection.²³

- Among the 134 countries covered in this *Report*, Ireland has the lowest maternal mortality ratio (1 death among 100,000 live births) while Chad has the highest maternal mortality ratio (1,500 deaths among 100,000 live births). Twenty-four countries have a maternal mortality ratio of greater than 500 deaths per 100,000 live births (Table E1).
- Annually, more than half a million women and girls die in pregnancy and childbirth and 3.7 million newborns die within their first 28 days.¹
- 99% of maternal deaths occur in developing countries. Half of these occur in sub-Saharan Africa and another third in South Asia.²
- A woman in a least-developed country is 300 times more likely to die from causes related to pregnancy and childbirth than a woman in an industrialized country in her lifetime.³
- Maternal and newborn health are intimately linked. Children who have lost their mothers are four times more likely to die prematurely than those who have not.⁴
- It is estimated that for every woman who dies, another 20 suffer from illness or disability as a result of pregnancy or childbirth—around 10 million women a year.⁵ Many of these women not only face discomfort and emotional distress, but are shunned by their families.⁶
- Every year about 1 million children are left motherless and vulnerable.⁷ They are less likely to attend school, which in turn means that they risk a life living in poverty as adults.⁸
- Approximately 80% of maternal deaths could be averted if women had access to essential maternity and basic healthcare services.⁹
- The five major direct causes of maternal death in developing countries are severe bleeding, infection, hypertension, complications from unsafe abortion and prolonged/ obstructed labour.¹⁰
- About 20% of maternal deaths have indirect causes that complicate pregnancy or childbirth such as malaria, anaemia, hepatitis and HIV/AIDS.¹¹
- Another serious factor is insufficient access for women and girls to nutritious food and essential micronutrients.¹²
- Weak healthcare systems often do not prioritize women's health.¹³
- A lack of skilled health workers to support a woman through pregnancy, childbirth and post-natal care. There is evidence that worker numbers and quality are positively associated with maternal survival.¹⁴

Table E1: Maternal mortality ratio (per 100,000 live births)

User's Guide: How Country Profiles Work

DAMARIS PAPOUTSAKIS

World Economic Forum

The Country Profiles present a compilation of selected data for each individual country included in *The Global Gender Gap Report 2009*.

1 Key Indicators

The first section presents the following indicators:

- The Global Gender Gap Index 2009 gives each country's overall performance in closing the gender gap on a 0-to-1 scale and its rank out of 134 reviewed countries.
- Population in millions of inhabitants: Source is the World Bank's *World Development Indicators Online* (accessed June 2009).
- Population Growth: Source is the World Bank's *World Development Indicators Online* (accessed June 2009).
- GDP in billions of US dollars: Source is the World Bank's *World Development Indicators Online* (accessed June 2009).
- GDP per capita in US dollars (constant) adjusted for purchasing power parity: Source is the World Bank's *World Development Indicators Online* (accessed June 2009).
- Mean age of marriage for women: Source is the OECD's *Gender, Institutions and Development Data Base* (accessed June 2009).
- Fertility rate (births per woman): Source is the World Health Organization's *World Health Statistics 2008*.
- Overall population sex ratio (male/female): Source is the OECD's Gender, Institutions and Development Data Base (accessed June 2009).
- Year women received the right to vote: Source is the United Nations Development Programme's *Human Development Report*. Data refer to the year in which the right to vote or stand for election on a universal and equal basis was recognized. Where two years are shown, the first refers to the first partial recognition of the right to vote or stand for election.

- The spider chart in the upper right-hand side compares the country's score for each of the four subindexes of the Global Gender Gap Index 2009 with the average score across all 134 countries. The centre of the chart corresponds to the lowest possible score (0), while the outermost corners of the chart correspond to the highest possible score (1), or equality. Please note that the equality benchmark is 1 for all variables except sex ratio at birth (0.944) and healthy life expectancy (1.06). Therefore, the equality benchmark of 1 for the health and survival subindex is not strictly true.

2 Gender Gap Subindexes

This section gives an overview of each country's rankings and the scores on the four subindexes of *The Global Gender Gap Report 2009*.

- For each of the variables that enter into the Global Gender Gap Index 2009, column one in this section displays ranks, column two displays the country scores, column three displays the population-weighted sample average (134 countries), column four displays the female value, column five displays the male value and, finally, column six displays the female-over-male ratio. To calculate the Index, all ratios were truncated at the equality benchmark of 1 (please refer to the chapter) and thus the highest score possible is 1. In the case of countries where women surpass men on particular variables, the reader can refer to the exact female and male values as well as the female-over-male ratio to understand the magnitude of the female advantage.
- The bar charts visually display the female-to-male ratio for each of the 14 variables, allowing the reader to see clearly when the female-to-male ratio is above or below the equality benchmark. Values above 1 (the equality benchmark) favour women and values below 1 favour men. Please note that the equality benchmark is 1 for all variables except sex ratio at birth (0.944) and healthy life expectancy (1.06). Therefore, the equality benchmark of 1 in the bar charts for these two variables is not strictly true. Finally, in the few cases where ratio exceeds the scale of the bar chart (which ends at 1.5), the reader should refer to the number under the "female-to-male ratio" column for the actual value.
- According to the UNDP, because of lack of gender-disaggregated income data, female and male earned income figures are crudely estimated on the basis of data on the ratio of the female non-agricultural wage to the male non-agricultural wage, the female and male shares of economically active population, the total female and male population and the GDP per capita in purchasing power parity (PPP) US\$. In previous years, the PPP was derived from the 1993 International Comparison Program Surveys. In 2008 the World Bank released the results of the 2005 survey. Therefore there are significant differences in certain countries and are the results of this data revision.
- For purposes of calculating their index, the UNDP scales downward the female and male values to reflect the maximum values of adult literacy (99%), gross enrolment ratios (100%) and GDP per capita (40,000) (PPP US\$). Source is the UNDP's *Human Development Report 2007/2008*.
- For the "legislators, senior officials and managers" and the "professional and technical workers" variables, we have previously reported Major Group 1 (Totally and Economically Active Population) and Major-Sub Group 1D (Economically Active Population, by occupation and status in employment) from the ILO's ISCO (88) – International Standard Classification of Occupations. We are now continuing to use Major Group 2 (Employment) and Major Sub-Group 2C (Total Employment, by Occupation) in order to remain consistent with the data obtained from the United Nations Development Programme.
- For estimation purposes, a value of 99% literacy rate is used for developed countries. The reason for this is that these countries no longer use the traditional measure of literacy, on which the UIS literacy data are based, and that is established on the basis of the individual or household response to the question "Can you read and write" on a national census or household survey. Many countries are now undertaking "literacy assessments" in order to measure "functional levels of literacy".
- The ILO has updated the model-based table upon which the female and male labour force participation rates are based. This has accounts for significant changes in certain countries.
- The abbreviation "female head of state" is used to describe an elected female head of state or head of a government.

3 Additional Data

This section compiles a selection of internationally available data that may be relevant for the country's gender gap. These data were not used for the calculations of the Global Gender Gap Index 2009. The indicators in this section are displayed in four broad categories: maternity and childbearing, education and training, employment and earnings and finally basic rights and social institutions.

Maternity and Childbearing

- Births attended by skilled health staff (%): Source is the World Health Organization's *Statistical Information System (WHOSIS)* (accessed June 2009).

- Contraceptive prevalence of married women (%): Source is the United Nations Statistics Division's *Statistics and Indicators on Women and Men* (2008).
- Infant mortality rate (per 1,000 live births): Source is the World Health Organisation's *Statistical Information System (WHOSIS)* (accessed June 2009).
- Length of paid maternity leave and leave benefits paid (%): Source is the United Nations Statistics Division's *Statistics and Indicators on Women and Men*. The data presented refer to laws and regulations in force at the time of the compilation of the information (between 2004 and 2006). Last updated in June 2009.
- Maternal mortality ratio (per 100,000 live births): Source is the World Health Organisation's *Statistical Information System (WHOSIS)* (accessed June 2009).
- Adolescent fertility rate (births per 1,000 women aged 15–19): Source is the World Health Organisation's *World Health Statistics 2009*.

scale, where 1 is the worst possible score and 0 the best possible score.

Education and Training

- Female teachers in primary education (%), female teachers in secondary education (%) and female teachers in tertiary education (%): Source is UNESCO Institute of Statistics' *Education Statistics* online database, 2008 or latest available data.

Employment and Earnings

- Female adult unemployment rate (%): Source is the World Bank's *World Development Indicators* online database, 2008 or latest available data.
- Male adult unemployment rate (%): Source is the World Bank's *World Development Indicators* online database, 2008 or latest available data.
- Women in non-agricultural paid labour (% of total labour force): Source is the United Nations *Millennium Goals Indicators*, 2007 or latest available data.
- Ability of women to rise to enterprise leadership: Source is the World Economic Forum's Executive Opinion Survey 2009. Survey question: "In your country, do businesses provide women the same opportunities as men to rise to positions of leadership? (1 = no, women are unable to rise to positions of leadership; 7 = yes, women are often in management positions)".

Basic Rights and Social Institutions

- Paternal versus maternal authority, female genital mutilation, polygamy and legislation punishing acts of violence against women: Source of all these variables is the OECD's *Gender, Institutions and Development Data Base* (accessed June 2009). The numbers are on a 0-to-1

Albania

Rank Score (0.000 = inequality, 1.000 = equality)

Gender Gap Index 2009 (out of 134 countries)	91	0.660
Gender Gap Index 2008 (out of 130 countries)	87	0.659
Gender Gap Index 2007 (out of 128 countries)	66	0.668
Gender Gap Index 2006 (out of 115 countries)	61	0.661

About the Authors

Ricardo Hausmann is Director of Harvard's Center for International Development and Professor of the Practice of Economic Development at the John F. Kennedy School of Government. Previously, he served as the first Chief Economist of the Inter-American Development Bank (1994–2000), where he created the Research Department. He has served as Minister of Planning of Venezuela (1992–93) and as a member of the Board of the Central Bank of Venezuela. He also served as Chair of the IMF-World Bank Development Committee. He was Professor of Economics at the Instituto de Estudios Superiores de Administracion (IESA) (1985–91) in Caracas, where he founded the Center for Public Policy. He holds a PhD in Economics from Cornell University. Professor Hausmann's research interests include issues of growth, macroeconomic stability, international finance and the social dimensions of development. He did pioneering work on the causes of macroeconomic volatility in developing countries and studied its effects on growth, poverty and inequality. He also studied the role of budgetary and political institutions in achieving fiscal balance and the role of foreign currency debts in causing economic crises. Professor Hausmann has made important contributions to the study of the "resource curse". More recently, his growth diagnostics methodology, designed to identify the binding constraints to growth in countries, has been adopted widely by multilateral organizations, and his breakthrough research on the patterns of change in productive structures is informing countries' industrial policies around the world. Professor Hausmann developed the methodology of the World Economic Forum Global Gender Gap Index, which looks into areas of health, education, economic participation and political power; he is also the co-author of the annual *Global Gender Gap Report*.

Laura D. Tyson is the S.K. and Angela Chan Professor of Global Management at the Haas School of Business, at the University of California at Berkeley. She served as Dean of the London Business School from 2002 to 2006, and as Dean of the Haas School of Business, University of California at Berkeley from 1998 to 2001. Dr. Tyson is a member of President Obama's Economic Recovery Advisory Board. She served in the Clinton Administration and was the Chair of The Council of Economic Advisers (1993–95) and the President's National Economic Adviser (1995–96). She is a Senior Adviser to the McKinsey Global Institute and the Center for American Progress. Dr. Tyson is also a member of the Brookings Institution Hamilton Project Advisory Council and a member of Newman's Own Advisory Board. She is a Director of LECG (Law and Economics Consulting Group) and is a member of the Boards of Directors of Eastman Kodak Company; Morgan Stanley; AT&T, Inc.; the Peter G. Peterson Institute of International Economics; the New America Foundation; and Silver Spring Networks. She has written books and articles on industrial competitiveness and trade. She has also written opinion columns for many publications including *Business Week*, *The New York Times* and the *Financial Times*, and she has made numerous television appearances on economic issues.

Saadia Zahidi is a Director and Head of Constituents at the World Economic Forum. Her responsibilities include the engagement of women leaders, gender parity groups, religious leaders, NGOs and labour leaders with the World Economic Forum. The Women Leaders & Gender Parity Programme aims to create awareness and catalyze change by benchmarking and tracking the global gender gap, promoting dialogue among women leaders, and engaging leaders—women and men—to collectively address the challenges and opportunities involved in narrowing gender gaps. Zahidi launched and was co-author of the Forum's reports *Women's Empowerment: Measuring the Global Gender Gap* and *The Global Gender Gap Report 2006, 2007 and 2008*. She was previously an Economist with the Forum's Global Competitiveness Programme, where her responsibilities included economic analysis for the *Global Competitiveness Reports*, *Arab World Competitiveness Reports* and other topical and regional studies. Zahidi holds a cum laude BA degree in Economics from Smith College, Massachusetts, USA and a Master of International Economics from the Graduate Institute of International Studies in Geneva, Switzerland.

With contributions from

Ina Ganguli is a PhD Candidate in Public Policy and a Doctoral Fellow at the Center for International Development at the John F. Kennedy School of Government at Harvard University. She is a Graduate Student Affiliate of the Institute for Quantitative Social Science and the Davis Center for Russian and Eurasian Studies at Harvard University. Her research interests include labour economics and international development, with a focus on immigration, education, innovation, and gender issues. She was previously an Embassy Policy Specialist in Tajikistan, a Fulbright Scholar in Ukraine and an International Parliamentary Program Fellow in Germany. Ganguli holds a Master of Public Policy from the University of Michigan and a Bachelor of Arts in Mathematical Methods in the Social Sciences from Northwestern University.

Damaris Papoutsakis is a Project Associate with the World Economic Forum's Women Leaders & Gender Parity Programme (until September 2009). She holds a Bachelor's degree in International Hospitality Management from the Ecole Hoteliere de Lausanne in Lausanne, Switzerland. Her interests include organisational behaviour, international cooperation for sustainable development and media trends in society.

Martina Viarengo is Research Officer at the London School of Economics where she works at the Centre for Economic Performance. She is Postdoctoral Fellow at the Harvard University's John F. Kennedy School of Government, a Fellow at the Women and Public Policy Program, and an Associate at the Center for International Development. In the past several years Martina has been examining education policy and labour market outcomes in the OECD and developing countries. Specifically, she has devoted her academic research to understanding how to improve access to quality education to reduce poverty and inequality. Martina is currently working on projects such as a comparative analysis of institutional changes and investment in education in Latin America as well as an examination of policy interventions and the gender education gap in developing countries. In addition to her PhD from the London School of Economics, Martina holds a Master degree from Northwestern University and a BA in Economics from the University of Turin. In 2009 Martina was elected a Fellow of the Royal Society of Arts, and in 2008 she was named Newton International Fellow by the British Academy, Royal Society and Royal Academy of Engineering. In 2006 she was a Rotary Scholar in Germany.

The World Economic Forum would like to thank Ernst & Young, Heidrick & Struggles, Manpower, McKinsey & Company, NYSE Euronext, and Renault-Nissan for their invaluable support of the Women Leaders Programme and this Report.

Ernst & Young is a global leader in assurance, tax, transaction and advisory services. Worldwide, its 135,000 people are united by their shared values and an unwavering commitment to quality. Ernst & Young makes a difference by helping its people, its clients and its wider communities achieve their potential.

The Renault-Nissan Alliance is a unique group of two global companies linked by cross-shareholding. The Alliance develops and implements a strategy of profitable growth and pursues three primary objectives:

- To be recognized by customers as one of the best three automotive groups in the quality and value of its products and services in each region and market segment;
- To rank among the best three automotive groups in key technologies, each partner being a leader in specific domains of excellence; and
- To consistently generate a total operating profit among the top automotive groups in the world by maintaining a high operating profit margin and pursuing growth.

Benchmarking and transparency lead to substantial savings and new opportunities for both Alliance partners in all areas. Renault and Nissan, which recognizes its 10th anniversary in 2009, utilize their strengths to place the Alliance among the world's most successful automotive groups, with record sales of more than 6 million units in 2008.
